

Directed domain-to-domain transportability and measured determinants

F Transportability summary and inference boundary

Directed performance

72 ordered transfers: mean ROC AUC = 0.489; median = 0.488; target-patient bootstrap re-estimation interval for the mean = 0.466–0.514.

Reciprocal differences

36 pairs: mean absolute difference = 0.134. The global domain-preserving null was not exceeded ($P = 0.066$); three pair-level tests were nominal, with minimum $q = 0.234$.

Robustness analyses

Route rankings changed across feature caps. After source-size matching to $n = 25$, mean asymmetry decreased to 0.094 while mean ROC AUC remained 0.489.

Measured determinants

MRQAP $R^2 = 0.066$. No measured ecological or domain-level factor was robustly associated with directed performance.
